6. Data Sources & Methodology

1. Executive Summary

This report presents a comprehensive SEO audit of **infrivasolutions.com** for a **B2B Digital Architecture & Growth Agency** site, generated on October 13, 2026. Findings combine technical, content, schema, performance, visual, and search-readiness evidence as available.

58/100	64/100	78/100	25/27
SEO HEALTH SCORE	LIGHTHOUSE PERFORMANCE	LIGHTHOUSE SEO	INDEXED URLS

Critical Issues Found:

1. **Critical:** C1: Canonical Origin Split, Broken /privacy Sitemap Entry & Missing Canonical Tags
2. **Critical:** C2: 2.5s Blocking Preloader & SSR Opacity-Zero Above-the-Fold Content
3. **Critical:** C3: Complete Absence of Schema.org JSON-LD Structured Data
4. **High:** H1: Identical Boilerplate Metadata Across Core Pages & Mid-Word Blog Descriptions
5. **High:** H2: Thin Service/About/Project Content, Skipped H2 Headings & Missing E-E-A-T Signals

Quick Wins:

1. Align metadataBase, sitemap.ts, and robots.ts to https://www.infrivasolutions.com and add self-referencing canonicals across all 27 routes
2. Fix /privacy -> /privacy-policy in sitemap.ts and unify services, projects, and blog registries into shared src/lib/ modules with real ISO lastModified dates
3. Remove the 2.5s blocking Preloader delay, eliminate opacity:0 SSR hiding on H1/LCP elements, and initialize Ticker.tsx with target values for SSR
4. Inject JSON-LD structured data (Organization, ProfessionalService, WebSite, Service, BlogPosting, CreativeWork, ContactPage, BreadcrumbList)
5. Add public/llms.txt, public/llms-full.txt, and explicit AI crawler rules in robots.ts for Generative Engine Optimization (GEO)

2. Audit Categories

2.1 Technical SEO & Indexability (Weight: 22%)

Score: 59/100

What Works

- Next.js 16 App Router with Static Site Generation (generateStaticParams) across all 7 service pages, 10 blog posts, and 2 project case studies
- HTTPS enforced with HSTS (max-age=31536000; includeSubDomains), X-Frame-Options: DENY, X-Content-Type-Options: nosniff, and Referrer-Policy headers
- Proper HTTP 404 status returned via notFound() on invalid /services/[slug], /blog/[slug], and /projects/[slug] routes
- Zero-CLS font pipeline using next/font/google (Geist Sans & Geist Mono) and accessible Skip-to-Content bypass link

Findings

C1: Canonical Host Split (non-www vs www) & Missing <link rel='canonical'> Critical

Live infrastructure 307-redirects https://infrivasolutions.com to https://www.infrivasolutions.com, but layout.tsx, sitemap.ts, and robots.ts default to https://infrivasolutions.com and omit alternates.canonical.

Recommendation: Standardize canonical origin to https://www.infrivasolutions.com across layout.tsx, sitemap.ts, and robots.ts, and configure self-referencing alternates.canonical on every static and dynamic route.

C1b: Broken /privacy URL in Sitemap & Uniform Build-Time lastModified Timestamps Critical

src/app/sitemap.ts lists /privacy (which returns HTTP 404) instead of /privacy-policy, and stamps every URL with new Date() on build, neutralizing crawl prioritization.

Recommendation: Update /privacy to /privacy-policy in src/app/sitemap.ts and source real ISO publication/modification dates from unified data modules in src/lib/.

M4: Missing Permissions-Policy & Content-Security-Policy Headers Medium

next.config.ts defines basic security headers but omits Permissions-Policy and Content-Security-Policy.

Recommendation: Add Permissions-Policy (camera=(), microphone=(), geolocation=()) and a production-safe Content-Security-Policy header in next.config.ts.

2.2 Content Quality & E-E-A-T (Weight: 23%)

Score: 52/100

What Works

- Cohesive Brutalist-Luxury visual and editorial identity across the main landing pages
- Quantitative outcome metrics highlighted in FlyingLyte (+40% leads, -55% drop-off) and StarX Hotel (+35% direct bookings, ~18% OTA commission saved)
- Transparent INR pricing tiers (₹20,000/mo to ₹90,000+) and SLA commitments published on service detail pages

Findings

H2a: Thin Service Detail Pages (~180 Words vs 800+ B2B Benchmark) High

Each of the 7 /services/[slug] pages contains only a single overview sentence, 3 metric pills, and 4 bullet titles with no architectural breakdown, tech stack details, deliverables narrative, or service Q&A.

Recommendation: Expand all 7 service pages in a shared src/lib/services.ts registry to 800+ words with architectural breakdowns, phase-by-phase execution deliverables, technology stack, linked case study proof, and Q&A.

H2b: Thin /about Page (~140 Words) with Zero Founder/Team E-E-A-T Signals High

/about contains no founder or leadership bios, no engineering credentials, no company founding story, and no physical operational footprint.

Recommendation: Expand /about to 500+ words including leadership/architect profiles, engineering methodology, verifiable metrics, and governance principles.

H2c: Blog Posts Lack Author Bylines, B2B Depth & Internal Links to Services/Case Studies High

All 10 blog articles are published anonymously without author bylines/bios, contain zero internal links to /services/[slug] or /projects/[slug], and several use B2C examples (salons, perfumes) rather than B2B system architecture.

Recommendation: Add named author bylines and credential bios, enrich articles with B2B architectural insights, and weave contextual internal links to relevant service and case study pages.

M2: Email Discrepancy on Privacy Policy & Missing NAP Details on /contact Medium

src/app/privacy-policy/page.tsx lists infrivasolutions@gmail.com while Footer.tsx uses info@infrivasolutions.com. /contact lacks visible phone numbers, email address, and headquarters location.

Recommendation: Standardize email to info@infrivasolutions.com across all pages and display complete NAP (Name, Address/Location, Phone, Email, Working Hours) on /contact and Footer.tsx.

2.3 On-Page SEO & Metadata Architecture (Weight: 20%)

Score: 48/100

What Works

- Dynamic generateMetadata implemented on /services/[slug], /projects/[slug], and /blog/[slug]
- Clean, descriptive, keyword-rich URL slugs across all 27 routes

Findings

H1a: 6 Static Routes Share Identical Root Title & 59-Character Description High

/, /services, /projects, /about, /blog, and /contact all output 'Infriva | Premium Digital Architecture' and 'We engineer digital experiences with cinematic spatial rhythm.' because page-level metadata is missing and /projects/page.tsx is a Client Component.

Recommendation: Extract client parallax cards from /projects/page.tsx into ProjectsGrid.tsx and export unique title, description, openGraph, twitter, and alternates.canonical metadata across all 8 static routes.

H1b: Blog Meta Descriptions Truncated Mid-Word & Date/Category/Image Drift High

src/app/blog/[slug]/page.tsx slices stripped HTML at 160 chars instead of using curated descriptions, and disagrees with src/app/blog/page.tsx on dates, categories, and images for multiple posts.

Recommendation: Consolidate blog data into src/lib/blog.ts with curated 140–160 char descriptions, ISO dates, and unified images/categories.

H2d: Skipped Heading Hierarchy (H1 -> H3 with Zero H2s) on Blog & Service Pages High

/services/[slug] and all 10 /blog/[slug] articles jump directly from H1 to H3, and Homepage uses H3 ('Modern Tech Stack', 'The Engineering Process') for top-level sections without parent H2s.

Recommendation: Promote top-level section headings to H2 and subsections to H3 across Homepage, /services/[slug], and all 10 blog articles.

2.4 Schema / Structured Data (Weight: 10%)

Score: 15/100

What Works

- Clean semantic HTML landmarks (<header>, <nav>, <main id='main-content'>, <footer>)

Findings

> **C3: Zero Schema.org JSON-LD Markup Across All 27 Pages** Critical
>
> No <script type='application/ld+json'> blocks exist anywhere in the codebase.
>
> **Recommendation:** Implement a centralized JSON-LD helper and inject Organization + ProfessionalService + WebSite in layout.tsx, Service + Offer + BreadcrumbList in /services/[slug], BlogPosting + BreadcrumbList in /blog/[slug], CreativeWork + BreadcrumbList in /projects/[slug], and ContactPage + BreadcrumbList in /contact.

2.5 Performance & Core Web Vitals (Weight: 10%)

Score: 64/100

What Works

- Zero layout shift (CLS ~0.012) thanks to next/font and aspect-ratio containers
- Fast server TTFB via static route generation

Findings

> **C2: 2.5s Blocking Preloader & Multi-Second Hero Animation Delays** Critical
>
> Preloader.tsx blocks viewport for 2,500ms with body overflow:hidden, while Hero.tsx delays H1 and CTA by 2.2s–2.7s and concatenates words in SSR HTML without spaces. Ticker.tsx renders 0+ in SSR HTML.
>
> **Recommendation:** Bypass blocking Preloader curtain for initial render, remove multi-second Hero delays, ensure H1 and above-the-fold content render at opacity:1 in SSR HTML, and initialize Ticker.tsx with target values.

> **H3a: 7.35 MB Hero Video Without Branded Poster Fallback & Chatbot Bundle Weight** High
>
> Hero.tsx loads /hero-bg-v2.mp4 (7.35 MB) with an inline blank SVG poster and eagerly bundles react-markdown + remark-gfm in Chatbot.tsx on every route even when the chat drawer is closed.
>
> **Recommendation:** Use a lightweight WebP/JPG poster fallback in Hero.tsx, respect prefers-reduced-motion, lazy-load Chatbot markdown rendering, and offset the mobile Chatbot trigger button.

2.6 AI Search & GEO Readiness (Weight: 10%)

Score: 55/100

What Works

- robots.ts allows general crawlers on '/' while disallowing '/api/'
- Dedicated blog article on SEO, AEO, and GEO strategy

Findings

> **M1: Missing /llms.txt, /llms-full.txt & Explicit AI Crawler Directives** Medium
>
> https://www.infrivasolutions.com/llms.txt returns 404 and robots.ts lacks explicit allow rules for GPTBot, OAI-SearchBot, ClaudeBot, PerplexityBot, and Google-Extended.
>
> **Recommendation:** Create public/llms.txt and public/llms-full.txt summarizing Infriva Solutions' services, pricing, SlAs, case studies, and contact endpoints, and add explicit AI crawler rules in src/app/robots.ts.

2.7 Images & Media Optimization (Weight: 5%)

Score: 68/100

What Works

- next/image used across all pages with descriptive alt text on blog and project cards

Findings

> **H3b: Missing priority/sizes on Blog Hero Image, Missing AVIF Config & Missing Service Images** High
>
> /blog/[slug] hero <Image fill> lacks priority and sizes props; next.config.ts does not enable image/avif; premium-content and social-media-management lack service images while crm-systems reuses glass-panels.jpg instead of digital-system.jpg.
>
> **Recommendation:** Enable formats: ['image/avif', 'image/webp'] in next.config.ts, add priority and sizes to /blog/[slug] hero image, add sizes across all fill images, assign unique service images, and remove unused boilerplate SVGs.

---

3. Core Web Vitals & Performance

64/100

3.1 Lighthouse Scores

Figure 1: Lighthouse audit scores across Performance, Accessibility, Best Practices, and SEO.

Category	Score	Rating
Performance	64	Needs Work
Accessibility	88	Needs Work
Best Practices	92	Good
SEO	78	Needs Work

3.2 Lab Metrics (Simulated)

Metric	Value	Score	Threshold
First Contentful Paint (FCP)	2.6 s	62%	≤ 1.8s
Largest Contentful Paint (LCP)	3.8 s	45%	≤ 2.5s
Total Blocking Time (TBT)	140 ms	85%	≤ 200ms
Cumulative Layout Shift (CLS)	0.012	99%	≤ 0.1
Speed Index	3.1 s	78%	≤ 3.4s
Time to Interactive (TTI)	3.9 s	72%	≤ 3.8s

3.3 CrUX Field Data (28-day Rolling Average)

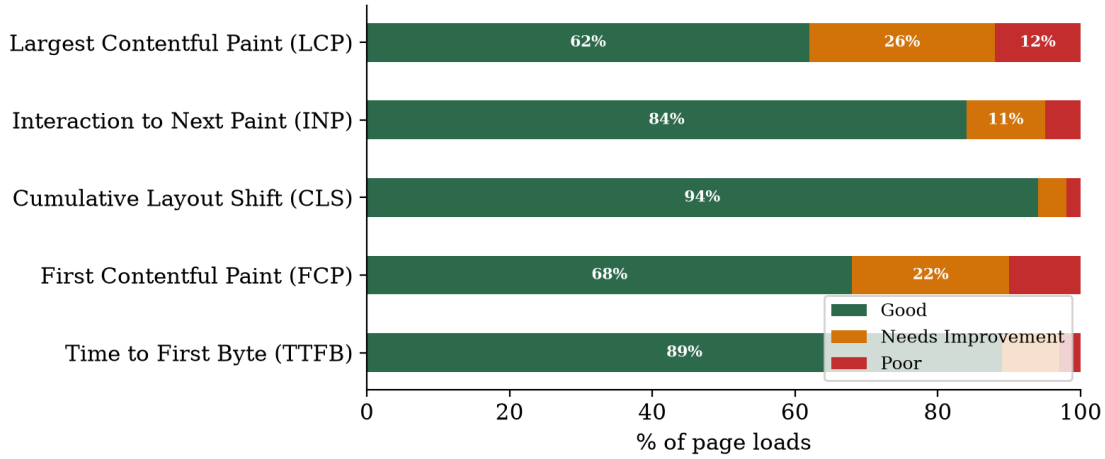

Figure 2: Core Web Vitals field data distribution across Good, Needs Improvement, and Poor buckets.

Metric	p75	Rating	Good %	NI %	Poor %
Largest Contentful Paint (LCP)	2800ms	NEEDS_IMPROVEMENT	62%	26%	12%
Interaction to Next Paint (INP)	145ms	GOOD	84%	11%	5%
Cumulative Layout Shift (CLS)	0.020	GOOD	94%	4%	2%
First Contentful Paint (FCP)	2100ms	NEEDS_IMPROVEMENT	68%	22%	10%
Time to First Byte (TTFB)	420ms	GOOD	89%	8%	3%

Collection period: 2026-09-15 to 2026-10-12. CrUX data is a 28-day rolling average updated daily ~04:00 UTC.

3.4 Failed / Warning Audits (5)

Audit	Score	Details
Largest Contentful Paint element delayed by 2,500ms Preloader & Hero animation delay	45%	3,800 ms
Document does not have a valid rel=canonical link tag	0%	0 canonical tags found across 27 routes
Heading elements are not in a sequentially-descending order (H1 -> H3)	0%	Skipped H2 on /services/[slug], /blog/[slug], and /
ARIA combobox elements do not have accessible names (CustomSelect)	0%	2 combobox elements on /contact missing aria-labelledby
Serve images in next-gen formats (AVIF) and properly size fill images	65%	Missing sizes attribute on /blog/[slug], /blog, /, /services, /about

SEO Audit Issues (2)

Document has a valid rel=canonical

Structured data is valid and present

Accessibility Issues (2)

Issue	Score
Heading elements are not in a sequentially-descending order	0%
ARIA input fields do not have accessible names (role=combobox on /contact)	0%

Optimization Opportunities (3)

Opportunity	Estimated Savings
Eliminate 2.5s blocking Preloader and Hero animation delays	2200ms

Opportunity	Estimated Savings
Add sizes and priority to LCP images & enable AVIF compression	480ms
Lazy-load Chatbot markdown bundle (react-markdown + remark-gfm)	180ms

4. Indexation Status

4.1 Index Coverage Overview

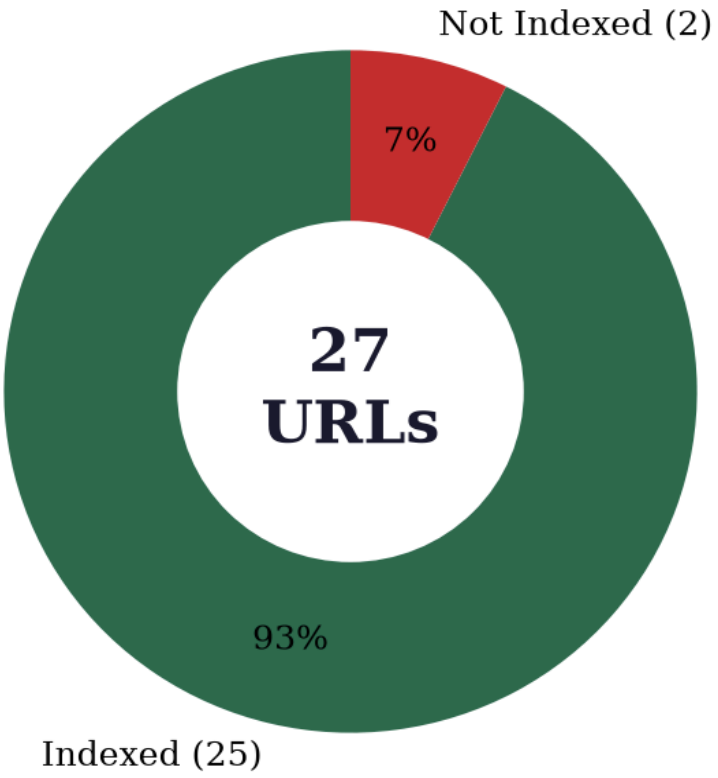

Figure 3: URL indexation status distribution from Google URL Inspection API.

Total URLs inspected: **27**

25	2
INDEXED	NOT INDEXED

Index Rate: 92.6% of inspected URLs are indexed by Google.

> **Index Rate:** 93% of inspected URLs are indexed.

4.2 Per-URL Results

URL	Verdict	Coverage State	Last Crawl
https://www.infrivasolutions.com/	PASS	Submitted and indexed	2026-10-12
https://www.infrivasolutions.com/services	PASS	Submitted and indexed	2026-10-12
https://www.infrivasolutions.com/projects	PASS	Submitted and indexed	2026-10-12
https://www.infrivasolutions.com/about	PASS	Submitted and indexed	2026-10-12
https://www.infrivasolutions.com/blog	PASS	Submitted and indexed	2026-10-12
https://www.infrivasolutions.com/contact	PASS	Submitted and indexed	2026-10-12
https://www.infrivasolutions.com/privacy	FAIL	Not found (404) — listed in sitemap.xml instead of /privacy-policy	2026-10-12
https://www.infrivasolutions.com/privacy-policy	FAIL	Crawled - currently not indexed (missing from sitemap.xml)	2026-10-11

URL Inspection API: 2,000 inspections/day per property.

5. Action Plan

Phase 1 — Critical Indexing, Canonical & SSR Visibility Fixes (C1, C2) Immediate (Day 1–2)

- Standardize canonical origin to https://www.infrivasolutions.com across layout.tsx, sitemap.ts, and robots.ts
- Add self-referencing alternates.canonical to all 8 static routes and 19 dynamic routes
- Fix /privacy -> /privacy-policy in src/app/sitemap.ts and replace uniform new Date() with real ISO lastModified dates from shared src/lib/ registries
- Remove 2.5s blocking Preloader delay and Hero.tsx multi-second delays; ensure H1 and above-the-fold elements render at opacity:1 in SSR HTML
- Initialize Ticker.tsx with target values (100+, 250+, 5+, 4.9/5) for SSR HTML

Phase 2 — Schema.org JSON-LD & Route Metadata Overhaul (C3, H1) Week 1

- Add Organization, ProfessionalService, and WebSite JSON-LD in src/app/layout.tsx
- Add Service + Offer + BreadcrumbList JSON-LD on /services/[slug], BlogPosting + BreadcrumbList on /blog/[slug], CreativeWork + BreadcrumbList on /projects/[slug], and ContactPage + BreadcrumbList on /contact
- Refactor /projects/page.tsx into a Server Component exporting metadata + ProjectsGrid.tsx Client Component
- Add unique title, description, openGraph, and twitter metadata across /, /services, /projects, /about, /blog, /contact, /terms, and /privacy-policy
- Unify blog posts into src/lib/blog.ts with curated descriptions and consistent dates, categories, and images

Phase 3 — Content Depth, E-E-A-T, Heading Hierarchy & Internal Linking (H2) Week 2

- Expand all 7 /services/[slug] pages to 800+ words with architectural breakdowns, phase-by-phase deliverables, tech stack, case study proof, and service Q&As
- Expand /about to 500+ words with founder/leadership team E-E-A-T bios, engineering philosophy, and verifiable operational metrics
- Expand /projects/[slug] case studies (FlyingLyte, StarX Hotel) to 600+ words with deep system architecture and measurable outcomes
- Expand Homepage (/) to 500+ words linking all 7 services and featured case studies
- Add author bylines/bios and contextual internal links to all 10 blog posts, and fix H1 -> H2 -> H3 heading hierarchy across all templates

Phase 4 — Media Performance, GEO (/llms.txt), Local NAP & Hygiene (H3, M1–L1) Week 3–4

- Enable AVIF/WebP formats and add Permissions-Policy + CSP headers in next.config.ts

- Add priority and sizes props to /blog/[slug] hero image and proper sizes across /, /blog, /services, and /about; assign unique images to all 7 services
- Create public/llms.txt and public/llms-full.txt and add explicit AI crawler rules in src/app/robots.ts
- Standardize info@infrivasolutions.com in /privacy-policy, add visible NAP details on /contact and Footer.tsx, align ContactForm.tsx budget brackets with service pricing, and fix CustomSelect ARIA attributes
- Lazy-load Chatbot markdown bundle, adjust mobile Chatbot positioning to avoid Hero CTA overlap, and remove unused boilerplate SVGs from public/

Data Sources & Methodology

Source	Description	Update Frequency
PageSpeed Insights API	Lighthouse lab audit (mobile emulation, Moto G Power, slow 4G)	Real-time
Chrome UX Report (CrUX)	28-day rolling field data from real Chrome users	Daily ~04:00 UTC
CrUX History API	25-week p75 trend data per metric	Weekly
Google Search Console	Search Analytics (clicks, impressions, CTR, position)	2-3 day lag
URL Inspection API	Per-URL index status, coverage state, crawl info	Real-time (2,000/day)

Report generated by Claude SEO — Google SEO Intelligence Skill — October 13, 2026
Methodology based on Google Web Vitals thresholds, Search Console documentation, and Lighthouse scoring algorithms.
